

PROJECT DOCUMENTATION

BrightHome Qualification Agent

Retell AI | Tayana Academy Topic 1 Assessment

Project type	AI voice agent / lead qualification
Agent setup	Single Prompt
Primary use case	Qualify residential cleaning quote inquiries
Demo	Watch Loom walkthrough
Source repository	GitHub repository

Project Overview

BrightHome Qualification Agent is an educational Retell AI voice-agent prototype designed to qualify callers who are seeking residential cleaning quotes. It collects essential lead details, handles specified out-of-scope inquiries, and confirms the captured details before ending a qualified conversation.

The implementation uses a Single Prompt configuration with five clearly labelled sections: Role & Persona, Conversation Goal, Disqualification Checks, Qualification Questions, and Closing & Summary.

Assessment note: This documentation describes the configuration and dashboard simulation results that were available during preparation. It does not claim a live production deployment or real appointment booking.

1. Goals and Scope

The agent is intended to make first-contact qualification consistent and clear while avoiding unsupported promises. Its main goals are to:

- Collect caller name and callback phone number.
- Identify the requested cleaning type and home size.
- Capture property address, city, and ZIP code.
- Capture the preferred start timeframe and optionally the referral source.
- Ask one question at a time and use details already provided during the same call.
- Repeat the collected details for caller confirmation before ending a qualified inquiry.
- Politely stop the qualification flow for confirmed commercial/office cleaning or unrelated vendor/sales calls.

2. Agent Configuration

Item	Configuration / notes
Platform	Retell AI
Agent name	BrightHome Qualification Agent
Agent type	Single Prompt
Use case	Residential cleaning quote qualification
Prompt sections	Role & Persona; Conversation Goal; Disqualification Checks; Qualification Questions; Closing & Summary
Welcome	Agent speaks first with a custom BrightHome greeting
Scheduling	Live availability and appointment booking are not verified as integrated

3. Qualification Flow

Cleaning type → Home size → City / ZIP / service address → Preferred timeframe → Optional referral source. The agent should adapt if the caller gives several answers at once, avoid asking for details already supplied, and request only information that remains missing.

Required captured information

- Full name
- Callback phone
- Cleaning type
- Home size (bedrooms, bathrooms, or approximate square footage)
- Service address
- City
- ZIP code
- Preferred start timeframe

4. Disqualification Rules

Commercial or office cleaning: Explain politely that the agent can assist only with residential cleaning inquiries, do not ask further qualification questions, and end the call.

Vendor or unrelated sales inquiry: Politely decline assistance for the unrelated inquiry and end the call without continuing the intake.

Out-of-area ZIP: The supplied assessment materials reviewed did not contain the official approved service-area ZIP list. The agent must not invent ZIP codes or claim a caller is in or out of area without verified data. Eligibility is therefore deferred for confirmation until the authoritative list is supplied.

5. Post-Call Analysis and Extraction

The project configuration includes the expected custom extraction fields:

full_name | callback_phone | service_address | city | zip_code | cleaning_type | home_size | preferred_timeframe | disqualification_reason | call_outcome

The call_outcome selector is configured with exactly two values: **Qualified** and **Disqualified**. Standard outputs reviewed include Call Summary, Call Successful, and User Sentiment.

6. Simulation Test Results

The Retell dashboard screenshots supplied for this project showed these test cases as Passed:

Test case	Dashboard result	Observed behavior
Happy Path Test - Fully Qualified Caller	Passed	Captured core details, gave a confirmation summary, and closed appropriately.
Commercial Service Disqualification Test	Passed	Recognized commercial/office cleaning as out of scope and ended politely.
Vendor / Spam Call Disqualification Test	Passed	Recognized an unrelated sales inquiry and used the end-call action.

These are dashboard-reported simulation results. A successful simulation does not establish that a live phone deployment, real-time availability lookup, or appointment booking has been implemented.

7. Known Limitations and Next Steps

- Obtain the official service-area ZIP-code list and complete supported residential cleaning-services list from the instructor or case-study owner. Do not fabricate these values.
- If the official data is provided, add it to the prompt and verify the resulting behavior against the assessment test cases.
- Review Call Logs and Post-Call Analysis for correct extraction, and retain screenshots for submission.
- Include the Loom walkthrough, this documentation, and the public GitHub repository in the LMS submission.
- Do not describe the prototype as booking appointments or checking live availability unless the relevant integration is implemented and verified.
